

1. Write the 5 given numbers into a file and then read them.
2. Write the string given from the keyboard in the file.
3. Copy the contents of one file to another. You can use the **fputc()** function, which places character by character in the indicated file by reading it in advance from the input file, or the **fgets()** function.
4. Count how many characters are in the file, use the **fseek()** and **ftell()** functions.
5. Load the contents of a text file, make calculations on how many times which letter repeats in it. Use **fgetc()**.
